Introduction

TP pumps are designed for applications such as

- district heating systems
- heating systems
- air-conditioning systems
- district cooling systems
- water supply
- industrial processes
- industrial cooling.

The pumps are available with either mains-operated motors (TP and TPD) or electronically speed-controlled motors (TPE and TPED).

The pumps are all single-stage, in-line centrifugal pumps with mechanical shaft seal. The pumps are of the close-coupled type, i.e. pump and motor are separate units. Consequently, the pumps are less sensitive to impurities in the pumped liquid than similar pumps of the canned rotor type.

TP, mains-operated pumps

The TP range is divided into the following four groups based on their construction: TP Series 100, 200, 300 and 400.

TP Series 100 with union or flange connection

Rp 1 (DN 25) to Rp 1½ (DN 32) and motor sizes from 0.12 to 0.25 kW.

For further information, see page 22.

TP Series 200 with flange connection

DN 32 to DN 100 and motor sizes from 0.12 to 2.2 kW.

For further information, see page 22.

TP Series 300 with flange connection

DN 32 to DN 200 and motor sizes from 0.25 to 132 kW.

For further information, see page 24.

TP Series 400 with flange connection

Grundfos offers two TP Series 400 versions:

- 10 bar version with DN 250 flange and motor sizes from 45 to 75 kW.
- 25 bar version with DN 100 to DN 400 and motor sizes from 5.5 to 630 kW.

For further information, see page 26.

TPE, speed-controlled pumps

Based on the construction and choice of material of TP pumps, Grundfos offers the following two series of speed-controlled TPE pumps:

- TPE Series 1000 pumps
(without factory-fitted differential-pressure sensor)
- TPE Series 2000 pumps
(with factory-fitted differential-pressure sensor)

TPE Series 1000 pumps

The difference between the TP and the TPE Series 1000 pump range is the motor. The motors of TPE Series 1000 pumps have built-in frequency converter.

Via an external signal (from a sensor or a controller), TPE Series 1000 pumps allow for any configuration and control method required: Constant pressure, temperature or flow.

For further information, see page 28.

TPE Series 2000 pumps

The main differences between the TP and the TPE Series 2000 pumps are the motor and the factory-fitted differential-pressure sensor.

TPE Series 2000 pumps are factory-set to proportional-pressure control.

The motors of TPE Series 2000 pumps have built-in frequency converter for continuous adjustment of the pressure to the flow rate.

The TPE Series 2000 range is recognized as a preset solution for quick and safe installation.

For further information, see page 30.

Why select a TPE pump?

A TPE pump with electronic speed control offers these obvious benefits:

- energy savings
- increased comfort
- control and monitoring of pump performance
- communication with the pump.

ATEX-approved TP pumps

On request, Grundfos offers TP and TPD pumps with ATEX-approval.

All ATEX-approved TP pumps are in accordance with Council directive 94/9/EC (Group II, category 3).

High-efficiency motors

TP pumps are fitted with high-efficiency motors.

2- and 4-pole TP pumps with motor sizes from 1.1 to 90 kW are fitted with high-efficiency motors (EFF1). EFF1 is the highest efficiency class defined by CEMEP.

Type key

Example	TP	E	D	65	-120	/2	-S	-A	-F	-A	-AUUE
Pump range											
Electronically speed-controlled pump (Series 1000, 2000)											
Twin-head pump											
Nominal diameter of suction and discharge ports (DN)											
Maximum head [dm]											
Pole number											
S = TPE Series 2000 (with factory-fitted differential pressure sensor)											
Code for pump version:											
A = Basic version											
I = PN 6 flange											
X = Special version											
Code for pipework connection:											
F = DIN flange											
O = Union											
Code for materials:											
A = Basic version											
Z = Bronze pump housing and pump head											
B = Bronze impeller											
Code for shaft seal (incl. other plastic and rubber pump parts, except the neck ring)											

Codes for shaft seal

Example	B	B	U	E
Grundfos type designation				
A = O-ring seal with fixed seal driver				
B = Rubber bellows seal				
D = O-ring seal, balanced				
G = Bellows seal with reduced seal faces				
R = O-ring seal with reduced seal faces				
Material of rotating face				
A = Carbon, antimony-impregnated				
B = Carbon, resin-impregnated				
Q = Silicon carbide				
U = Tungsten carbide				
Material of stationary seat				
B = Carbon, resin-impregnated				
Q = Silicon carbide				
U = Tungsten carbide				
Material of secondary seal				
E = EPDM				
P = NBR rubber				
V = FKM

● Standard.

¹⁾ Bronze versions are only available as single-head pumps.

²⁾ 2-pole motors above 11 kW can be operated at 3 x 660-690 YV. Smaller motor sizes cannot.

³⁾ 2-pole TPE Series 2000 pumps with MMGE motors from 7.5 to 22.0 kW are not available as twin-head pumps.

400.0	-	75	-
500.0	-	75	-
560.0	-	78	-
630.0	-	78	-

Note: The values apply only to MGE and Siemens motors.

The audible noise from TP pumps is primarily noise from the motor fan. The selection of TPE pumps will reduce the noise at partial load, as the motor, and consequently, the motor fan runs at a lower speed. Possible flow noise from control valves is also reduced at partial load in the case of the TPE pump.

Ambient temperature

MG – EFF1-motors: 1.1-11 kW motors, 2-pole 1.1-4 kW, 4-pole	–30 to +60 °C
Siemens – EFF1-motors: 15-90 kW motors, 2-pole 5.5-90 kW motors, 4-pole	–30 to +55 °C
MGE/MMGE and other motor sizes:	–30 to +40 °C
Storage:	Down to –30 °C

If the ambient temperature exceeds above maximum values or if the motor is located more than 1000 metres above sea level, the motor output (P_2) must be reduced due to the low density and consequent low cooling effect of the air. In such cases, it may be necessary to use an oversize motor with a higher rated output.

2	MG – EFF1-motors: 1.1-11 kW motors, 2-pole 1.1-4 kW, 4-pole
3	MGE/MMGE and other motor sizes

Pumped liquids

Thin, clean, non-aggressive and non-explosive liquids, not containing solid particles or fibres that may mechanically or chemically attack the pump, please see "List of pumped liquids" on page 19.

Examples of liquids:

- central heating system water (the water should meet the requirements of accepted standards on water quality in heating systems)
- cooling liquids
- domestic hot water
- industrial liquids
- softened water.

If glycol or another antifreeze agent is added to the pumped liquid, the pump must have a shaft seal of the type RUUE or GQQE.

The pumping of liquids with densities or kinematic viscosities higher than those of water can cause

- a considerable pressure drop
- a drop in the hydraulic performance
- a rise in the power consumption.

In these situations, equip the pump with an oversize motor. If in doubt, contact Grundfos.

If the water contains mineral oils or chemicals, or if other liquids than water are pumped, the O-rings should be chosen accordingly.

Liquid temperature

Liquid temperature: -25 °C to +150 °C.

Please note that shaft seals operating close to their maximum temperature will require regular maintenance, i.e. replacement.

Pump type	Shaft seal	Temperature
TP Series 100	BUBE	0 °C to +110 °C
	BQQE	0 °C to +90 °C
	GQQE	-25 °C to +90 °C
TP Series 200	BUBE	0 °C to +140 °C
	AUUE	0 °C to +90 °C
	RUUE	-25 °C to +90 °C
TP Series 300	BAQE	0 °C to +120 °C (140 °C) ¹⁾
	BQQE	0 °C to +90 °C
	GQQE	-25 °C to +90 °C (60 °C) ²⁾
TP Series 400, 10 bar version	BAQE	0 °C to +120 °C
	BQQE	0 °C to +90 °C
	GQQE	-25 °C to +90 °C
TP Series 400, 25 bar version	DBUE	0 °C to +150 °C ³⁾

¹⁾ TP Series 300 pumps are designed for a maximum operating temperature of 140 °C. For operation above 120 °C, an alternative shaft seal is to be selected. Contact Grundfos.

²⁾ The below listed TP Series 300 pumps with GQQE shaft seals are designed for a maximum operating temperature of 60 °C.

TP 150-260/4	TP 200-180/4
TP 150-280/4	TP 200-220/4
TP 150-340/4	TP 200-250/4
TP 150-390/4	TP 200-270/4
	TP 200-320/4
	TP 200-330/4
	TP 200-360/4
	TP 200-400/4
	TP 200-410/4
	TP 200-470/4
	TP 200-530/4
	TP 200-590/4
	TP 200-660/4

³⁾ At +120 to +150 °C, the maximum operating pressure ≤23 bar.

Depending on the type of cast iron used and the pump application, the maximum liquid temperature may be limited by local regulations and laws.

List of pumped liquids

Grundfos TP and TPD pumps are designed for circulation systems with constant flow; TPE and TPED pumps for systems with variable flow.

Thanks to their design, the pumps can be used in a wider liquid temperature range than pumps of the canned rotor type.

A number of typical liquids are listed below.

Other pump versions may be used, but we consider the ones stated in the list to be the best choices.

The list is intended as a general guide only, and it cannot replace actual testing of the pumped liquids and pump materials under specific working conditions. If in doubt, contact Grundfos.

Use the list with some caution, as factors such as concentration of the pumped liquid, liquid temperature or pressure may affect the chemical resistance of a specific pump version.

Legend

A	May contain additives or impurities that may cause shaft seal problems.
B	The density and/or viscosity differ from those of water. Consider this when calculating motor and pump performance.
C	The liquid must be oxygen-free (anaerobic).
D	Risk of crystallisation/precipitation in the shaft seal.
E	Insoluble in water.
F	The shaft seal rubber parts must be replaced with FKM rubber.
G	Bronze housing/impeller required.
H	Risk of formation of ice on the standby pump. (The risk only applies to TP, TPE Series 200 pumps.)

¹⁾ BAQE must **not** be used for potable water. For potable water, Grundfos recommends a BBQE shaft seal.

²⁾ BAQE can be used in air-condition applications at temperatures above 0 °C.

³⁾ The shaft seal is not standard, but available on request.

⁴⁾ Maximum +110 °C.

Fig. 2 TP Series 100 and TP Series 200

Technical data

Flow rate:	Up to 90 m ³ /h
Head:	Up to 27 m
Liquid temperature (TP Series 100):	–25 to +110 °C
Liquid temperature (TP Series 200):	–25 to +140 °C
Maximum operating pressure:	Up to 16 bar
Direction of rotation:	Counter-clockwise

Construction

Grundfos TP Series 100 and Series 200 pumps are single-stage, close-coupled pumps with in-line suction and discharge ports of identical diameter.

The pumps are equipped with a fan-cooled asynchronous motor. Motor and pump shafts are connected via a rigid two-part coupling.

TP Series 100 pumps with union connection are available as single-head (TP) pumps.

TP Series 200 pumps are available as single-head (TP) and twin-head (TPD) pumps.

TP Series 200 pumps have PN 6 or PN 10 flanges.

The pumps are equipped with an unbalanced mechanical shaft seal.

The pumps are of the top-pull-out design, i.e. the power head (motor, pump head and impeller) can be removed for maintenance or service while the pump housing remains in the pipework.

The twin-head pumps are designed with two parallel power heads. A non-return flap valve in the common discharge port is opened by the flow of the pumped liquid and prevents backflow of liquid into the idle pump head.

As radial and axial forces are absorbed by the fixed bearing in the motor drive-end, the pump requires no bearing.

TP, TPD Series 100 and 200 pumps are equipped with high-efficiency motors.

Pumps with bronze pump housing (version B) are suitable for circulation of domestic hot water.

Materials

TP Series 100

Fig. 3 Sectional drawing of TP Series 100 (with union connection)

Material specification of Series 100

Pos.	Component	Material	EN/DIN

Material specification of Series 200

Pos.	Component	Material	EN/DIN
1	Pump housing	Cast iron EN-GJL-250, bronze CuSn10	EN-JL 1040 2.1093
2	Impeller	Stainless steel	1.4301
3	Shaft	Stainless steel	1.4305
4	Coupling	Cast iron EN-GJL-400	0.7040
5	Pump head	Cast iron EN-GJL-250, bronze	0.6025 2.1093
	Secondary seals	EPDM	
	Rotating seal face	Tungsten carbide	
	Stationary seat	Carbon (resin-impregnated) Tungsten carbide	

Mechanical shaft seal

Three types of unbalanced mechanical shaft seal are available as standard:

• BUBE

The BUBE shaft seal is a Grundfos rubber bellows seal with tungsten carbide/carbon seal faces and secondary seals of EPDM.

• RUUE/GQQE

The RUUE shaft seal is a Grundfos O-ring seal with reduced tungsten carbide/tungsten carbide seal faces and secondary seals of EPDM.

The GQQE shaft seal is a Grundfos rubber bellows seal with reduced silicon carbide/silicon carbide seal faces and secondary seals of EPDM.

• AUUE/BQQE

The AUUE shaft seal is a Grundfos O-ring seal with fixed seal driver, tungsten carbide/tungsten carbide seal faces and secondary seals of EPDM.

The BQQE shaft seal is a Grundfos rubber bellows seal with silicon carbide/silicon carbide seal faces and secondary seals of EPDM.

Information on a selection of common pumped liquids with recommended shaft seals is shown on page 19.

Shaft seal specification

Unbalanced shaft seal	TP Series 100	Version KU according to EN 12756
	TP, TPD Series 200	Version NU according to EN 12756
Shaft diameter	12 and 16 mm	
Rubber bellows	EPDM	
Seal faces	Tungsten carbide/carbon	
	Tungsten carbide/tungsten carbide	
	Silicon carbide/silicon carbide	

Special shaft seals are available for partly conditioned water or other liquids containing abrasive or crystallising particles. See page 19.

Connections

TP Series 100 pumps with union connection have suction and discharge union threads to ISO 228-1.

TP Series 200 pumps up to DN 65 are equipped with combination flanges PN 6/PN 10. DN 80 or DN 100 pumps have either PN 6 or PN 10 flanges. All flanges can be connected to flanges in accordance with EN 1092-2 and ISO 7005-2.

Features and benefits

TP Series 100 and Series 200 pumps have these features and benefits:

Optimised hydraulics for high efficiency

- Reduced power consumption.

High-efficiency motors

- TP pumps are fitted with high-efficiency motors. High-efficiency motors offer reduced energy consumption. 2-pole and 4-pole TP pumps from 1.1 kW have EFF1 motors.

Top-pull-out design

- Easy dismantling in case of service.

In-line design

- Contrary to end-suction pumps, in-line pumps allow a straight pipework and thus often reduced installation costs.

Pump housing and pump head are electrocoated to improve the corrosion resistance

- Electrocoating includes:

1. Alkaline cleaning.
2. Pretreatment with zinc phosphate coating.
3. Cathodic electrocoating (epoxy).
4. Curing of paint film at 200-250 °C.

For low-temperature applications at a high humidity, Grundfos offers TP pumps with extra surface treatment to avoid corrosion. These pumps are available on request.

Stainless steel impeller and neck ring

- Wear-free operation with high efficiency.

TPE, TPED - pumps with built-in frequency converter

- 2-pole and 4-pole TP pumps from 0.37 and upwards are available as TPE pumps with built-in frequency converter. For further information, see pages 4 and 11-14.

Fig. 5 TP Series 300

Technical data

Flow rate:	Up to 825 m ³ /h
Head:	Up to 93 m
Liquid temperature:	–25 to +140 °C
Maximum operating pressure:	16 bar
Direction of rotation:	Clockwise

Construction

Grundfos TP, TPD Series 300 pumps are single-stage, close-coupled pumps with in-line suction and discharge ports of identical diameter.

The pumps are equipped with a fan-cooled asynchronous motor. Motor and pump shafts are connected via a rigid sleeve coupling.

Most TP Series 300 pumps are available as single-head (TP) and twin-head (TPD) pumps.

TP Series 300 pumps have PN 16 flanges.

The pumps are equipped with an unbalanced mechanical shaft seal.

The pumps are of the top-pull-out design, i.e. the power head (motor, pump head and/or motor stool and impeller) can be removed for maintenance or service while the pump housing remains in the pipework.

The twin-head pumps are designed with two parallel power heads. A non-return flap valve in the common discharge port is opened by the flow of the pumped liquid and prevents backflow of liquid into the idle pump head.

As radial and axial forces are absorbed by the fixed bearing in the motor drive-end, the pump requires no bearing.

The impeller is hydraulically balanced to minimize axial forces.

TP, TPD Series 300 pumps are equipped with high-efficiency motors.

TP Series 300 pumps with bronze impeller are suitable for pumping brine.

Materials

Fig. 6 Sectional drawing of TP Series 300

Material specification

Pos.	Component	Material	EN/DIN
1	Pump housing	Cast iron EN-GJL-250	EN-JL 1040
2	Impeller	Cast iron EN-GJL-200, bronze CuSn5Zn5Pb	EN-JL 1030 2.1096.01
3	Shaft/sleeve coupling	Steel/stainless steel	
4	Pump head/motor stool	Cast iron EN-GJL-250	EN-JL 1040
	Secondary seals	EPDM	
	Rotating seal face	Metal-impregnated carbon Silicon carbide	
	Stationary seat	Silicon carbide	

Mechanical shaft seal

Three types of unbalanced mechanical shaft seal are available as standard:

- **BAQE**
The BAQE shaft seal is a Grundfos rubber bellows seal with carbon/silicon carbide seal faces and secondary seals of EPDM.
- **GQQE**
The GQQE shaft seal is a Grundfos rubber bellows seal with reduced silicon carbide/silicon carbide seal faces and secondary seals of EPDM.
- **BQQE**
The BQQE shaft seal is a Grundfos rubber bellows seal with silicon carbide/silicon carbide seal faces and secondary seals of EPDM.

Information on a selection of common pumped liquids with recommended shaft seals is shown on page 19.

Shaft seal specification

Unbalanced shaft seal	Version NU according to EN 12756
Shaft diameter	28, 38, 48 and 55 mm
Rubber bellows	EPDM
Seal faces	Carbon/silicon carbide Silicon carbide/silicon carbide

Special shaft seals are available for partly conditioned water or other liquids containing abrasive or crystallising particles. See page 19.

Connections

TP Series 300 pumps have PN 16 flanges. All dimensions are according to ISO 7005-2 or EN 1092-2.

Features and benefits

TP Series 300 pumps have these features and benefits:

Optimised hydraulics for high efficiency

- Reduced power consumption.

High-efficiency motors

- TP pumps are fitted with high-efficiency motors. High-efficiency motors offer reduced energy consumption. 2-pole and 4-pole TP pumps from 1.1 kW to 90 kW have EFF1 motors.

Top-pull-out design

- Easy dismantling in case of service.

In-line design

- Contrary to end-suction pumps, in-line pumps allow a straight pipework and thus often reduced installation costs.

Motor-pump shaft with sleeve coupling

- Stable and quiet operation.
- Easy dismantling in case of service.

Hydraulically and mechanically balanced impeller

- The impeller is hydraulically and mechanically balanced to increase the life of motor bearings and shaft seal.

Pump housing and pump head/motor stool are electrocoated to improve the corrosion resistance

- Electrocoating includes:
 1. Alkaline cleaning.
 2. Pretreatment with zinc phosphate coating.
 3. Cathodic electrocoating (epoxy).
 4. Curing of paint film at 200-250 °C.

For low-temperature applications at a high humidity, Grundfos offers TP pumps with extra surface treatment to avoid corrosion. These pumps are available on request.

TPE, TPED - pumps with built-in frequency converter

- 2-pole and 4-pole TP pumps from 0.37 to 22 kW are available as TPE pumps with built-in frequency converter. For further information, see page 4 and 11-14.

Technical data

Flow rate:	PN 10 version:	Up to 950 m ³ /h
	PN 25 version:	Up to 4500 m ³ /h
Head:	PN 10 version:	Up to 38 m
	PN 25 version:	Up to 170 m

Liquid temperature:

PN 10 version:	–25 to +120 °C
PN 25 version:	0 to +150 °C *

* From +120 to +150 °C, max. 23 bar

Maximum operating pressure:

10 bar version:	10 bar
25 bar version:	25 bar

Direction of rotation: Clockwise

Construction

Grundfos TP Series 400 pumps are single-stage, close-coupled pumps with in-line suction and discharge ports.

The pumps are equipped with a fan-cooled asynchronous motor. Motor and pump shafts are connected via a rigid flange coupling.

TP Series 400 pumps are available as single-head (TP) pumps.

All TP Series 400 pumps have PN 10 or PN 25 flanges. The largest pumps have DN 400, PN 40 discharge flanges and a maximum operating pressure of 25 bar.

The pumps are equipped with an unbalanced mechanical shaft seal.

The pumps are of the top-pull-out design, i.e. the power head (motor, motor stool and impeller) can be removed for maintenance or service while the pump housing remains in the pipework.

As radial and axial forces are absorbed by the fixed bearing in the motor drive-end, the pump requires no bearing.

TP Series 400 pumps are equipped with high-efficiency motors.

Mechanical shaft seal

For 10 bar versions, the following three types of unbalanced mechanical shaft seal are available as standard:

- **BAQE**

The BAQE shaft seal is a Grundfos rubber bellows seal with carbon/silicon carbide seal faces and secondary seals of EPDM.

- **GQQE**

The GQQE shaft seal is a Grundfos rubber bellows seal with reduced silicon carbide/silicon carbide seal faces and secondary seals of EPDM.

- **BQQE**

The BQQE shaft seal is a Grundfos rubber bellows seal with silicon carbide/silicon carbide seal faces and secondary seals of EPDM.

For 25 bar versions, the following mechanical shaft seal is available as standard:

- **DBUE**

The DBUE shaft seal is a Grundfos balanced O-ring seal with carbon/tungsten carbide seal faces and secondary seals of EPDM.

Information on a selection of common pumped liquids with recommended shaft seals is shown on page 19.

Special shaft seals are available for partly conditioned water or other liquids containing abrasive or crystallising particles. See page 19.

Connections

TP Series 400 pumps are the only TP pumps with suction and discharge ports of different diameters. The suction port is one dimension larger than the discharge port in order to obtain a low inlet velocity. This reduces risk of cavitation and noise.

From DN 100 to DN 300 TP Series 400 pumps have flanges according to ISO 7005-2 or EN 1092-2.

Features and benefits

TP Series 400 pumps have the following features and benefits:

Optimised hydraulics for high efficiency

- Reduced power consumption.

High-efficiency motors

- TP pumps are fitted with high-efficiency motors. High-efficiency motors offer reduced energy consumption. 2-pole and 4-pole TP pumps from 1.1 to 90 kW have EFF1 motors.

Top-pull-out design

- Easy dismantling in case of service.

In-line design

- Contrary to end-suction pumps, in-line pumps allow a straight pipework and thus often reduced installation costs.

Motor-pump shaft with flange coupling

- Stable and quiet operation.
- Easy dismantling in case of service.

Supported flange connection

- Pump housing flanges have integrated feet in order to stabilise the pump.

Surface treatment

TP Series 400 pumps are given the following surface treatment:

Pump type	Electrocoating	Spray painting
TP Series 400 (from DN 100 to DN 300)	x	x
TP Series 400 (DN 400)		2x

Electrocoating includes:

1. Alkaline cleaning
2. Pretreatment with zinc phosphate coating
3. Cathodic electrocoating (epoxy)
4. Curing of paint film at 200-250 °C.

For low-temperature applications at a high humidity, Grundfos offers TP pumps with extra surface treatment to avoid corrosion. These pumps are available on request.

TM03 0347 4904

Fig. 9 TPE and TPED Series 1000

Technical data

Flow rate:	Up to 380 m ³ /h
Head:	Up to 90 m
Liquid temperature:	–25 to +140 °C
Max. operating pressure:	16 bar
Motor sizes (single-phase):	0.37 to 1.1 kW
Motor sizes (three-phase):	0.55 to 22 kW

Construction

TPE, TPED Series 1000 pumps are based on TP, TPD Series 100, 200 and 300 pumps.

The main difference between the TP and the TPE Series 1000 pump range is the motor. The motor of TPE Series 1000 pumps has a built-in frequency converter for continuous adjustment of the pressure to the flow rate.

TPE Series 1000 pumps are suitable for applications where the pressure, temperature, flow rate or another parameter is to be controlled on the basis of signals from a sensor at some point in the system.

Note: TPE Series 1000 pumps are **not** fitted with a sensor from factory.

For further information on construction and materials of TPE Series 1000 pumps, see pages 22 to 25.

Applications

TPE Series 1000 pumps have integrated speed control for automatic adaptation of performance to current conditions.

This ensures that the energy consumption is kept at a minimum.

TPE Series 1000 pumps can operate in any duty point within the range between 25 % and 100 % speed.

TM01 4916 1099

Fig. 10 Duty range of TPE Series 1000 pumps

The 100 % curve corresponds to the curve of a pump with a mains-operated motor.

Depending on the application, TPE Series 1000 pumps offer energy-savings, increased comfort or improved processing.

The pumps can be fitted with sensor types meeting the requirements mentioned in the data booklet titled 'Grundfos E-pumps'.

The charts below show possible control modes of TPE Series 1000 pumps in different applications.

Control mode	Application
Constant curve	
	Single-pipe heating systems. Systems with three-way valves. Heating and cooling surfaces. Chiller pumps.
Constant differential pressure	
	Systems with two-way valves. (Sensor is needed.)
Temperature control	
	Single-pipe heating systems. Systems with three-way valves. Cooling towers. Chiller pumps. Domestic hot water recirculation systems. (Sensor is needed.)
Constant flow rate	
	Heating and cooling surfaces. Cooling towers. Flow filters. (Sensor is needed.)
Proportional differential pressure (measured)	
	System with two-way valves. (The differential pressure sensor is located in the system.)

Operating modes of twin-head pumps

The following operating modes are available for twin-head pumps:

Alternating operation

The two pumps run alternately for 24 operating hours. In case of fault in the operating pump, the other pump will start.

Standby operation

One pump is in constant operation. Every 24 operating hours the standby pump will start and run for a short period to prevent it from seizing up. In case of fault in the operating pump, the standby pump will start.

The operating mode is selected by means of a selector switch in each terminal box.

In case of sensor fault, the operating pump will switch to maximum operation.

Control options

Communication with TPE, TPED Series 1000 pumps is possible via

- a central building management system
- a remote control (Grundfos R100) or
- a control panel.

The purpose of controlling a TPE, TPED Series 1000 pump is to monitor and control the pressure, temperature, flow rate and liquid level of the system.

For further information on control options of TPE pumps, see page 32.

TM03 0348 4904

Fig. 11 TPE Series 2000

Technical data

Flow rate:	Up to 380 m ³ /h
Head:	Up to 90 m
Liquid temperature:	–25 to +140 °C
Max. operating pressure:	16 bar
Motor sizes (single-phase):	0.37 to 1.1 kW
Motor sizes (three-phase):	0.55 to 22 kW

Construction

TPE, TPED Series 2000 pumps are based on TP, TPD Series 200 and 300 pumps.

The main differences between the TP and the TPE Series 2000 pumps are the motor and the factory-fitted differential pressure sensor.

The motor of TPE Series 2000 pumps has built-in frequency converter for continuous adjustment of the pressure to the flow rate.

The TPE Series 2000 range is a preset solution for quick and safe installation.

A second sensor can be retrofitted in order to obtain security of back-up.

For further information on construction and materials of TPE Series 2000 pumps, see pages 22 to 25.

Applications

TPE Series 2000 pumps have integrated speed control for automatic adaptation of performance to current conditions.

This ensures that the energy consumption is kept at a minimum.

TPE Series 2000 pumps can operate in any duty point within the range between 25 % and 100 % speed.

TM01 4916 1099

Fig. 12 Duty range of TPE Series 2000 pumps

The 100 %-curve corresponds to the curve of a pump with a mains-operated motor.

Depending on the application, TPE Series 2000 pumps offer energy-savings, increased comfort or improved processing.

TPE Series 2000 pumps are suitable for applications requiring pressure control.

Proportional pressure

TPE Series 2000 pumps are factory-set to proportional pressure control. We recommend proportional pressure control in systems with relatively large pressure losses, as it is the most economical control mode.

TPE Series 2000 pumps set to proportional pressure control continuously adjust the pump head to the water requirement of the system. The setpoint is factory-set to 50% of the maximum pump head.

The pumps can be retrofitted with sensor types meeting the requirements mentioned in the data booklet titled 'Grundfos E-pumps'.

The charts below show possible control modes of TPE Series 2000 pumps in different applications.

Control mode	Application
Proportional pressure	
	Systems with two-way valves. - The head against a closed valve is 50 % of the setpoint.
Constant pressure	
	Systems with two-way valves.
Constant curve	
	Single-pipe heating system. Systems with three-way valves. Heating and cooling surfaces. Chiller pumps.

Operating modes of twin-head pumps

The following operating modes are available for twin-head pumps:

Alternating operation

The two pumps run alternately for 24 operating hours. In case of fault in the operating pump, the other pump will start.

Standby operation

One pump is in constant operation. Every 24 operating hours the standby pump will start and run for a short period to prevent it from seizing up. In case of fault in the operating pump, the standby pump will start.

The operating mode is selected by means of a selector switch in each terminal box.

In case of sensor fault, the operating pump will switch to maximum operation.

Control options

Communication with TPE, TPED Series 2000 pumps is possible via

- a central building management system
- a remote control (Grundfos R100) or
- a control panel.

The purpose of controlling TPE, TPED Series 2000 pumps is to monitor and control the pressure, temperature, flow rate and liquid level of the system.

For further information on control options of TPE pumps, see page 32.

Communication with TPE, TPED pumps

Communication with TPE, TPED pumps is possible via a central building management system, remote control (Grundfos R100) or control panel.

Central building management system

The operator can communicate with a TPE, TPED pump at a distance. Communication can take place via a central building management system allowing the operator to monitor and change control modes and setpoint settings.

Fig. 13 Structure of a central building management system

TM02 6592 1103

Remote control

The R100 remote control produced by Grundfos is available as an accessory.

The operator can communicate with the TPE, TPED pump by pointing the IR-signal transmitter at the control panel of the terminal box.

TM03 0141 4104

Fig. 14 R100 remote control

The operator can monitor and change control modes and settings of the TPE, TPED pump via the R100 display.

Control panel

The operator can change the setpoint settings manually on the control panel of the TPE, TPED pump terminal box.

TM00 7600 0404

Fig. 15 Control panel of a TPE pump

Affinity equations

Normally, TPE, TPED pumps are used in applications characterised by a **variable** flow. Consequently, it is not possible to select a pump that is constantly operating at its optimum efficiency.

In order to achieve optimum operating economy, the duty point should be close to the optimum efficiency (eta) for most operating hours.

Between the min. and max. performance curves, TPE, TPED pumps have an infinite number of performance curves each representing a specific speed. It may therefore not be possible to select a duty point close to the max. curve.

TM01 4916 4803

Fig. 16 Min. and max. performance curves

In situations where it is not possible to select a duty point close to the max. curve, use the affinity equations below. The head (H), the flow rate (Q) and the input power (P) are the appropriate variables you need for calculating the motor speed (n).

Note: The approximated formulas apply on condition that the system characteristic remains unchanged for n_n and n_x , and that it is based on the formula $H = k \times Q^2$ where k is a constant.

The power equation implies that the pump efficiency is unchanged at the two speeds. In practice this is **not** quite correct.

Finally, it is worth noting that the efficiency of the frequency converter and the motor **must** be taken into account if a precise calculation of the power saving resulting from a reduction of the pump speed is wanted.

TM00 8720 3496

Fig. 17 Affinity equations

Legend

H_n	Rated head in metres
H_x	Current head in metres
Q_n	Rated flow rate in m³/h
Q_x	Current flow rate in m³/h
n_n	Rated motor speed in min ⁻¹
n_x	Current motor speed in min ⁻¹
η_n	Rated efficiency in %
η_x	Current efficiency in %

WinCAPS and WebCAPS

WinCAPS and WebCAPS are selection programs offered by Grundfos.

The two programs make it possible to calculate the specific duty point and energy consumption of a TPE pump.

When you enter the dimensions of the pump, WinCAPS and WebCAPS can calculate the exact duty point and energy consumption. For further information, see page 138.

Motors

Motors fitted on TP pumps are totally enclosed, fan-cooled motors with main dimensions to IEC and DIN standards. Electrical tolerances to IEC 34.

Mounting designation

Pump type	Mounting designation - IEC 34-7
TP Series 100	IM 3601 (IM B 14) / IM 3611 (IM V 18)
TP Series 200	
TP Series 300	IM 3001 (IM B 5) / IM 3011 (IM V 1)
TP Series 400	IM 3001 (IM B 5) / IM 3011 (IM V 1)

Relative humidity:	Max. 95 %
Enclosure class:	IP 55
Insulation class:	F, to IEC 85
Ambient temperature:	Max. +55 °C (EFF1 motors) Max. +40 °C (other motors) Min. -30 °C

If the pump is installed in humid locations, open the lowest drain hole in the motor. This will reduce the motor enclosure class to IP 44.

MG and MGE are Grundfos motor brands.

Siemens and MMGE are sourced high-quality motor brands.

The grey-shaded areas indicate non-available motors.

High-efficiency motors

TP pumps are fitted with high-efficiency motors.

TP, TPD pumps with 2- and 4-pole three-phase motors from 1.1 to 90 kW are equipped with EFF1 motors.

TPE, TPED pumps with three-phase motors, 2-pole from 1.1 to 7.5 kW and 4-pole from 1.1 to 4.0 kW, are equipped with motors equivalent to EFF1.

EFF1 is the highest efficiency class defined by CEMEP (European Committee of Manufacturers of Electrical Machines and Power Electronics).

Motor protection

MG, Siemens

Single-phase motors have integrated, interconnected thermal switches.

Three-phase motors must be connected to a motor-protective circuit breaker.

All three-phase mains-operated motors can be connected to an external frequency converter.

If you connect a frequency converter, the motor insulation system will often be overloaded, and the motor will be more noisy than in normal operation. In addition, large motors will be exposed to bearing currents caused by the frequency converter.

If you operate the motor via a frequency converter, consider the following:

- In 2-, 4- and 6-pole motors of 75 kW (frame size 250) and upwards, isolate one of the motor bearings electrically to prevent damaging currents from passing through the motor bearings.
- If you have noise-sensitive applications, you can reduce the motor noise by fitting a dU/dt filter between the motor and the frequency converter. For particularly noise-sensitive applications, we recommend a sinusoidal filter.
- The length of the cable between motor and frequency converter affects the motor load. Therefore, check that the cable length meets the specifications laid down by the frequency converter supplier.
- For supply voltages between 500 and 690 V, fit either a dU/dt filter to reduce voltage peaks, or use a motor with reinforced insulation.
- For supply voltages of 690 V, use a motor with reinforced insulation, and fit a dU/dt filter.

MGE, MMGE

MGE, MMGE motors with built-in frequency converter do not require protection by a motor-protective circuit breaker.

Mechanical installation

TP, TPD, TPE, TPED pumps with motors smaller than 11 kW can be installed in horizontal or vertical pipework.

TM00 3734 0897

Fig. 18 Installation of motor sizes smaller than 11 kW

TP, TPD, TPE, TPED pumps with motors of 11 kW and up may only be installed in horizontal pipes with the motor in vertical position.

TM00 3735 0897

Fig. 19 Installation of motor sizes of 11 kW and up

Note: The motor must never point downwards.

Install the pumps in such a way that strain from the pipework is not transferred to the pump housing.

Pumps with motors smaller than 11 kW may be suspended direct in the pipes, provided the pipework can support the pump. If not, install the pump on a mounting bracket or base plate.

Pumps with motors of 11 kW and up may only be installed in horizontal pipes with the motor placed in vertical position. Always install the pump on an even and rigid foundation.

When installing a twin-head pump in a horizontal pipe and with horizontal shaft, fit the upper pump housing with an automatic air vent.

TM03 8127 0507

Fig. 20 Twin-head pumps with automatic air vent

Twin-head pump housings have two Rp 1/4 tappings (TP Series 200) or four Rp 1/8 tappings (TP Series 300) for mounting of automatic air vents.

TM02 7533 3703

Fig. 21 Tappings for mounting of automatic air vents in TP Series 200 and TP Series 300

For further information about identification of TP Series 200 and TP Series 300 models, see page 22 to 24.

If the liquid temperature falls below the ambient temperature, condensation may form in the motor during inactivity. In this case, the drain hole in the motor flange must be open and points downwards. See fig. 22.

TM00 9831 3202

Fig. 22 Drain hole

If twin-head pumps are used for pumping liquids with a temperature below 0 °C/32 °F, condensed water may freeze and cause the coupling to get stuck. The problem can be remedied by installing heating elements. Whenever possible, pumps with motors smaller than 11 kW should be installed with horizontal motor shaft. See fig. 20.

Cooling

To ensure sufficient cooling of motor and electronics, observe the following:

- Place the pump in such a way that sufficient cooling is ensured.
- Make sure that the temperature of the cooling air does not exceed +40 °C.
- Keep the motor cooling fins, holes in fan cover and fan blades clean.
- Make sure the frequency for the motor is at least 6 Hz (12 % of maximum speed).

Condensation cover for TPE pumps

When installing TPE pumps outdoors, provide the motor with a suitable cover to avoid condensation on the electronic components and to protect the pump and motor against the direct effects of the elements.

When mounting the condensation cover on top of the motor, make sure to leave enough space for the air to cool the motor.

Fig. 23 Speed-controlled motors with condensation cover

TM03 0372 5004

Elimination of noise and vibrations

In order to achieve optimum operation and minimum noise and vibration, consider vibration dampening of the pump. Generally, always consider this for pumps with motors of 11 kW and up, but for motors of 90 kW and up vibration dampening should be considered as mandatory. Smaller motor sizes, however, may also cause undesirable noise and vibration.

Noise and vibration are generated by the revolutions of the motor and pump and by the flow in pipes and fittings. The effect on the environment is subjective and depends on correct installation and the state of the remaining system.

Elimination of noise and vibrations is best achieved by means of a concrete foundation, vibration dampers and expansion joints.

Fig. 24 Foundation of TP pump

TM02 4993 2102

Concrete foundation

Install the pump on a plane and rigid concrete foundation. This is the optimum solution for vibration dampening. As a rule of thumb, the weight of a concrete foundation should be 1.5 times the pump weight.

Recommended concrete foundations for TP Series 300 pumps

For TP Series 300 pumps with weights of 150 kg or more, it is recommended to mount the pump on a concrete foundation with the dimensions stated in the table below. The same recommendation applies for TPD Series 300 pumps with weights of 300 kg or more.

TM03 9190 3507

Fig. 25 Foundation for TP Series 300 pumps

Concrete foundation dimensions			
Pump mass [kg]	Y (Height) [mm]	Z (Length) [mm]	X (Width) [mm]

1650	630	1250	1250
1700	635	1270	1270

Vibration dampers

To prevent the transmission of vibrations to buildings, we recommend you to isolate the pump foundation from building parts by means of vibration dampers.

The selection of the right vibration damper requires the following data:

- forces transmitted through the damper
- motor speed considering speed control, if any
- required dampening in % (suggested value is 70 %).

Which is the right damper varies from installation to installation, and a wrong damper may increase the vibration level. Vibration dampers should therefore be sized by the supplier.

If you install the pump on a foundation with vibration dampers, always fit expansion joints on the pump flanges. This is important to prevent the pump from "hanging" in the flanges.

Expansion joints

Install expansion joints to

- absorb expansions/contractions in the pipework caused by changing liquid temperature.
- reduce mechanical strains in connection with pressure surges in the pipework.
- isolate mechanical structure-borne noise in the pipework (only rubber bellows expansion joints).

Note: Do not install expansion joints to compensate for inaccuracies in the pipework such as centre displacement of flanges.

Fit expansion joints at a distance of minimum 1 to 11/2 times the nominal flange diameter away from the pump on the suction as well as on the discharge side. This will prevent the development of turbulence in the expansion joints, resulting in better suction conditions and a minimum pressure loss on the pressure side. At high water velocities (> 5 m/s) we recommend you to install larger expansion joints corresponding to the pipework.

The illustration below shows examples of rubber bellows expansion joints with or without limit rods.

TM02 4979 1902 - TM02 4981 1902

Fig. 26 Examples of rubber bellows expansion joints

Expansion joints with limit rods can be used to reduce the effects of the expansion/contraction forces on the pipework. We always recommend expansion joints with limit rods for flanges larger than DN 100.

Anchor the pipes in such a way that they do not stress the expansion joints and the pump. Follow the supplier's instructions and pass them on to advisers or pipe installers.

The illustration below shows an example of a metal bellows expansion joint with limit rods.

TM02 4980 1902

Fig. 27 Example of metal expansion joint

Due to the risk of rupture of the rubber bellows, metal bellows expansion joints may be preferred at temperatures above +100 °C combined with high pressure.

Terminal box positions

TP single-head pumps

As standard, the terminal boxes of TP and TPE pumps are mounted in position 9 o'clock.

The possible terminal box positions are shown below.

TM03 0565 2005

Fig. 28 Possible terminal box positions

Note: Due to the motor construction the terminal boxes of some TP pumps with motor sizes above 250 kW are mounted in position 10:30.

TPD twin-head pumps

As standard, the terminal boxes of all TPD and most TPED pumps are mounted in position 12 o'clock, see fig. 28. The TPED pumps with terminal boxes in position 10:30 and 13:30 are listed in the table.

TM02 8630 0604

Fig. 29 Terminal box positions of TPED pumps

Note: The B4 dimension can be seen in the tables of technical data of the individual pump. See the sections on performance curves and technical data.

Electrical installation

Electrical connection

Carry out electrical connection and protection in accordance with local regulations.

- The pump must be connected to an external mains switch with a minimum contact gap of 3 mm in all poles.
- Electronically speed-controlled pumps must always be correctly earthed.
Note: The 4.0 - 22 kW motors must be connected to especially reliable/sturdy earth connections to avoid earth leakage currents above 3.5 mA.
- Single-phase motors incorporate thermal protection and require no additional motor protection.
- Three-phase mains-operated motors must be connected to a motor-protective circuit breaker.
- Motors as from 3 kW incorporate thermistors (PTC). The thermistors are designed according to DIN 44082.
- When the pump is switched on via the mains, the pump will start after approx. 5 seconds.

Note: Carry out the mains connection of the pump as shown in the diagram inside the terminal box cover.

Do not start the pump until it has been filled with liquid and vented.

Protection

Protection against fault currents

If the pump is connected to an electric installation where an earth leakage circuit breaker (ELCB) is used as additional protection, the earth leakage circuit breaker must be marked with the following symbols.

- Single-phase:

The earth leakage circuit breaker **must** trip out when earth fault currents with DC content (pulsating DC) occur.

- Three-phase:

The earth leakage circuit breaker **must** trip out when earth fault currents with DC content (pulsating DC) and smooth DC earth fault currents occur.

Protection against voltage peaks

If you use speed controllers or frequency converters of other makes than Grundfos, you may have the following problems:

- increased motor noise
- detrimental voltage peaks
- additional motor losses.

Pumps with voltage peaks exceeding 650 V (maximum value) must therefore be protected. The voltage increase rate dU/dt must not exceed 500 V μ s. Noise and detrimental voltage peaks can be prevented by fitting an LC filter between the speed controller and the motor.

Communication cables for TPE, TPED

Use screened cables (min. 0.5 mm²) for external on/off switch, digital input, sensor and setpoint signals. The screens of the cables should be connected to frame at both ends.

The screen of the cable must have good frame connection which must be as close as possible to the terminals.

TM02 1325 0901

Fig. 30 External start/stop cable connection of TPE, TPED

Use a screened 2-core cable for the bus connection. Connect the screen to terminal Y at both ends.

TM02 1343 1001

Fig. 31 Bus connection of TPE, TPED

Other connections, TPE, TPED

See the wiring diagrams for instructions on how to connect external potential-free contacts for start/stop and digital function, external setpoint signal and fault signal.

Connect the wires to the following terminal groups:

Group 1: Inputs (external start/stop, digital function, setpoint and sensor signals, terminals 1-9 and bus connection, A, Y, B).

All inputs are separated from the mains conducting parts by reinforced insulation.

Group 2: Output (signal relay).

The output, terminals C, NO and NC, are galvanically separated from other circuits. Therefore, the supply voltage or protective extra-low voltage can be connected to the output as desired.

Group 3: Mains supply.

Note:

- As a precaution, separate the wires from each other by reinforced insulation in their entire lengths.
- If no external on/off switch is connected, maintain the connection across terminals 2 and 3.

PN 40 flanges

Technical drawing of a flange showing dimensions D_1 , D_2 , D_3 , and S . The drawing includes a top view and a side view. The top view shows three concentric circles with diameters D_1 (outermost), D_2 (middle), and D_3 (innermost). There are eight bolt holes arranged in a circle between D_1 and D_2 . The side view shows the flange thickness S .

How to read the curve charts

Curve conditions

The guidelines below apply to the curves shown on the following pages:

1. Tolerances to ISO 9906, Annex A.
2. The curves apply to the **performance of single-head three-phase pumps**. For other pump versions, please see the exact curves in WinCAPS or WebCAPS. For other pump versions, the performance may differ for the following reasons:
 - The valve in twin-head pumps may cause losses.
 - Single-phase motors run at lower speed.**Note:** Grundfos does not recommend continuous parallel operation of twin-head pumps due to the increased flow in the pump. A too high flow results in noisy operation, increased wear of the impeller due to cavitation, etc.
3. QH curves of the individual single-head pumps are shown with expected speed of a three-phase mains-operated motor. For further information, see the tables of technical data on the following pages. The performance of the single-phase motor is slightly reduced. Please refer to WinCAPS or WebCAPS for the exact single-phase curves.
4. Curves of TPE Series 1000 pumps, TPE Series 2000 pumps and TPE pumps without pressure sensor are shown as max. curves (100 % curves) only. Please refer to WinCAPS for the exact curves.
5. Measurements have been made with airless water at a temperature of +20 °C.
6. The curves apply to a kinematic viscosity of $\nu = 1 \text{ mm}^2/\text{s}$ (1 cSt).
7. Due to the risk overheating, the pump must not run constantly below the minimum flow rate indicated by the bold curves.
8. If the pumped liquid density and/or viscosity are higher than those of water, it may be necessary to use a motor with a higher performance.

Insulating kits

Insulating kits are only available for TP, TPE Series 200 pumps. An insulating kit consists of two or three insulating covers made of expanded polypropylene (EPP).

The insulating kit is tailored to the individual pump model and has an insulating thickness corresponding to the nominal diameter of the pump.

The thermal conductivity of EPP is very low (0.04 W/m °C), i.e. the insulating property is very good.

The insulating kit encloses the entire pump housing.

Fig. 35 Insulating kit

Fitting kit for TPED with two sensors		96491010

Select the differential pressure sensor so that the maximum pressure of the sensor is higher than the maximum differential pressure of the pump.

Potentiometer

Potentiometer for setpoint setting and start/stop of the pump.

Product	Product number
External potentiometer with cabinet for wall mounting.	625468

R100

R100 is used for wireless communication.
Communication takes place by means of infrared light.

Product	Product number
R100	625333

G10-LON interface

The G10-LON interface is used in connection with data transmission between a Locally Operating Network (LON) and electronically controlled Grundfos pumps applying the Grundfos bus-protocol GENIbus.

Product	Product number
G10-LON interface	00605726

EMC filter

MMGE motors comply with the limits of EN 61800-3 (emission) for use in second environments (industrial areas), unrestricted distribution, corresponding to CISPR11, group 2, class A.

If MMGE motors (7.5-22 kW) are equipped with an external EMC filter, they comply with the limits for first environments (residential areas), unrestricted distribution, corresponding to CISPR11, group 1, class B.

TM02 9198 1203

Fig. 36 EMC filter

The EMC filter is available as a complete kit ready for installation.

EMC kit	Product number
• EMC filter in IP 54 aluminium cabinet • Accessories for connection to motor terminal box: - 1 reducer from M40 x 1.5 to M32 x 1.5 - 1 EMC nut M40 x 1.5 - 1 EMC cable gland M32 x 1.5 - Installation and operating instructions	96478309

EMC-filter is required for installation of pumps of 5.5 kW and higher in residential areas.

Product	Product number
EMC-filter (5.5, 4-pole, and 7.5 kW, 2-pole)	96041047
EMC-filter (7.5 - 22 kW, 4-pole)	96478309

To ensure optimum and noiseless operation we recommend the minimum inlet pressure values shown on page 135 to 137.

A minimum inlet pressure is required to avoid pressure drop that may cause cavitation.

The minimum inlet pressure (p_s) in bar relative (pressure gauge value on the pump suction side) can be calculated using the following formula.

Note: Calculation of the minimum inlet pressure should be based on the maximum required flow.

$$p_s \geq \left((NPSH_R + H_s) \times \rho \times g - \left(\frac{1}{2} \times \rho \times c^2 \right) \right) \times 0.00001 - p_b + p_d \quad [\text{bar relative}]$$

- p_s = Minimum inlet pressure in bar.
- $NPSH_R$ = The required Net Positive Suction Head in metres head.
(To be read from the NPSH curve at the highest flow the pump will be delivering).
- H_s = Safety margin = minimum 0.5 metres head.
Note: A safety margin of 0.5 metres prevents pressure drop.
- ρ = Density of the pumped liquid measured in kg/m^3 .
- g = Gravitational acceleration measured in m/s . For estimated calculations use the value 9.81 m/s^2 .
- c = Flow velocity of the pumped liquid at the pressure gauge. Insert the flow velocity as the unit $[\text{m/s}]$.
(See individual curve charts from page 46).
- p_b = Barometric pressure in bar.
(Set the barometric pressure to 0.97 bar)
Note: Only occasionally is the pressure as high as 1 bar; also this value is at sea level.
- p_d = Vapour pressure in bar. (See fig. 37).

WebCAPS

WebCAPS is a **Web**-based **Computer Aided Product Selection** program available on www.grundfos.com.

WebCAPS contains detailed information on more than 185,000 Grundfos products in more than 20 languages.

In WebCAPS, all information is divided into 6 sections:

- Catalogue
- Literature
- Service
- Sizing
- Replacement
- CAD drawings.

Catalogue

This section is based on fields of application and pump types, and contains

- technical data
- curves (QH, Eta, P1, P2, etc) which can be adapted to the density and viscosity of the pumped liquid and show the number of pumps in operation
- product photos
- dimensional drawings
- wiring diagrams
- quotation texts, etc.

Literature

In this section you can access all the latest documents of a given pump, such as

- data booklets
- installation and operating instructions
- service documentation, such as Service kit catalogue and Service kit instructions
- quick guides
- product brochures, etc.

Service

This section contains an easy-to-use interactive service catalogue. Here you can find and identify service parts of both existing and discontinued Grundfos pumps. Furthermore, this section contains service videos showing you how to replace service parts.

Sizing

This section is based on different fields of application and installation examples, and gives easy step-by-step instructions in how to

- select the most suitable and efficient pump for your installation
- carry out advanced calculations based on energy consumption, payback periods, load profiles, life cycle costs, etc.
- analyse your selected pump via the built-in life cycle cost tool
- determine the flow velocity in wastewater applications, etc.

Replacement

In this section you find a guide to selecting and comparing replacement data of an installed pump in order to replace the pump with a more efficient Grundfos pump. The section contains replacement data of a wide range of pumps produced by other manufacturers than Grundfos.

Based on an easy step-by-step guide, you can compare Grundfos pumps with the one you have installed on your site. When you have specified the installed pump, the guide will suggest a number of Grundfos pumps which can improve both comfort and efficiency.

CAD drawings

In this section it is possible to download 2-dimensional (2D) and 3-dimensional (3D) CAD drawings of most Grundfos pumps.

These formats are available in WebCAPS:

- 2-dimensional drawings:
 - .dxf, wireframe drawings
 - .dwg, wireframe drawings.
- 3-dimensional drawings:
 - .dwg, wireframe drawings (without surfaces)
 - .stp, solid drawings (with surfaces)
 - .eprt, E-drawings.

WinCAPS

Fig. 38 WinCAPS CD-ROM

WinCAPS is a **Windows-based Computer Aided Product Selection** program containing detailed information on more than 185,000 Grundfos products in more than 20 languages.

The program contains the same features and functions as WebCAPS, but is an ideal solution if no Internet connection is available.

WinCAPS is available on CD-ROM and updated once a year.
